Sec 3.9: Related Rates

• Problem Solving Strategy:

- **1.** Read the problem carefully.
- 2. Draw a diagram if possible.
- 3. Introduce notation. Assign symbols to all quantities that are functions of time.
- 4. Express the given information and the required rate in terms of derivatives.
- 5. Write an equation that relates the various quantities of the problem. If necessary, use the geometry of the situation to eliminate one of the variables by substitution.
- **6.** Use the Chain Rule to differentiate both sides of the equation with respect to t.
- 7. Substitute the given information into the resulting equation and solve for the unknown rate.
- Example 1: Air is being pumped into a spherical balloon so that its volume increases at a rate of 100 cm³/s. How fast is the radius of the balloon increasing when the diameter is 50 cm.

• Example 2: A ladder 10 ft long rests against a vertical wall. If the bottom of the ladder slides away from the wall at a rate of 0.5 ft/s, how fast is the top of the ladder sliding down the wall when the bottom of the ladder is 5 ft from the wall?

• Example 3: A water tank has the shape of an inverted circular cone with base radius 2 m and height 4 m. If water is being pumped into the tank at a rate of 2 m³/min, find the rate at which the water level is rising when the water is 3 m deep.

• Example 4: Car A is traveling west at 50 mi/h and car B is traveling north at 60 mi/h. Both are headed for the intersection of the two roads. At what rate are the cars approaching each other when car A is 0.3 mi and car B is 0.4 mi from the intersection?

• Example 5: A man walks along a straight path at a speed of 4 ft/s. A searchlight is located on the ground 20 ft from the path and is kept focused on the man. At what rate is the searchlight rotating when the man is 15 ft from the point on the path closest to the searchlight?
